

Week 4: General rules about authorship and contributions:

Below are sections from nature portfolio: <https://www.nature.com/nature-portfolio/editorial-policies/authorship>, copied at Sep 21, 2026

Authorship

Authorship provides credit for a researcher's contributions to a study and carries accountability. Authors are expected to fulfil the criteria below (adapted from [McNutt et al.](#), Proceedings of the National Academy of Sciences, Feb 2018, 201715374; DOI: 10.1073/pnas.1715374115; licensed under [CC BY 4.0](#)):

- Each author is expected to have made substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data; or the creation of new software used in the work; or have drafted the work or substantively revised it;
- AND to have approved the submitted version (and any substantially modified version that involves the author's contribution to the study);
- AND to have agreed both to be personally accountable for the author's own contributions and to ensure that questions related to the accuracy or integrity of any part of the work, even ones in which the author was not personally involved, are appropriately investigated, resolved, and the resolution documented in the literature.

Corresponding Author:

It is expected that the corresponding author (and on multi-group collaborations, at least one member of each collaborating group, usually the most senior member of each submitting group or team, who accepts responsibility for the contributions to the manuscript from that team) will be responsible for the following with respect to data, code and materials: (adapted from [McNutt et al.](#), Proceedings of the National Academy of Sciences, Feb 2018, 201715374; DOI: 10.1073/pnas.1715374115; licensed under [CC BY 4.0](#)):

- ensuring that data, materials, and code comply with transparency and reproducibility standards of the field and journal and in our case, lab reports;
- ensuring that original data/materials/code upon which the submission is based are preserved following best practices in the field so that they are retrievable for reanalysis;
- confirming that data/materials/code presentation accurately reflects the original;
- foreseeing and minimizing obstacles to the sharing of data/materials/code described in the work
- ensuring that all authors (or group leaders in multi-lab collaborations) have certified the author list and author contributions.

Co-authors:

Nature Portfolio journals (so are Advanced Lab I) also allow one set of co-authors to be specified as having contributed equally to the work and one set of co-authors to be specified as having jointly supervised the work. Other equal contributions are best described in author contribution statements. Corresponding authors have specific responsibilities (described above).

Author contribution statements:

Advanced Lab I requires transparency by publishing author contribution statements. Authors are required to include a statement of responsibility in the manuscript, including review-type articles, that specifies the contribution of every author. The level of detail varies; some disciplines produce manuscripts that comprise discrete efforts readily articulated in detail, whereas other fields operate as group efforts at all stages.

Here's one example:

Author contributions F.G., K.M., and J.X. conceived and designed the project; X.L., Z.W., and J.X., fabricated and characterized the device with help from V.N., and J.C.; Y.X., Y.Y., and H.C. conducted the deep learning algorithms and closed-loop systems; J.X., X.L., Y.X., and Z.W., performed the animal experiments for device and system validation with support from H.-T.C., G.S., T.W., and H.B.; Y.X., Y.Y., X.L., Z.W., Z.A., C.T., K.M., and F.G. analyzed the data; Y.X. and X.L. wrote the manuscript with edits from other authors. All experiments were conducted under the supervision of F.G. All authors read and approved the final manuscript.
